

## Please Have Lubrication Operation Performed by Personnel with Appropriate Expertise

### Request

---

If lubrication is performed the wrong way, there is a risk it could have a negative impact on workpieces and machines.

For example:

- If too much grease is supplied, there is a risk that grease will splatter and workpieces will be contaminated by it.
- If axes requiring lubrication are not lubricated regularly, they will not operate smoothly, which will have a negative impact on accuracy.
- If different types of grease are mixed and used, there is a risk that the grease will deteriorate and the axis will not operate properly.

We ask that you have personnel with the appropriate expertise perform lubrication operations.

### Information about training services

---

DISCO offers training services using actual machines, including lubrication operations.

For details of our training services, please contact the training center.

#### Regarding training services
